marking liquid
designed for
regular marking.*

■ Primeline Concentrate

Primeline is a concentrated marking compound, specially formulated for playing surfaces that require regular marking. **Primeline** concentrate produces strong white lines that last and offer ease of application through all spray machines or transfer wheel markers. The product is extremely economical in use without compromising the quality of line.

■ Which applicators?

Primeline is formulated to be applied through the iGO or other compatible spray machines, or transfer wheel markers. Optimum effects through spray markers are achieved using flat fan nozzles.

■ Coverage:

For initial marking a dilution rate of 2:1 (water to paint) is recommended, dependant on grass condition and club preference to the finished line.

For over-marking up to 4:1 (water to paint) is recommended, at which ratio **Primeline** will give a line of outstanding opacity, durability and depth of colour.

■ Cleaning:

After the marking operation, the machines should be flushed through thoroughly using clean water to avoid any build-up of paint in the spray machine system. The reservoir of transfer wheel marking machines, should be emptied of surplus paint, and the reservoir and wheels flushed with clean water, to prevent build-up of paint and possibility of paint flakes affecting the next operation.
