Finesse® miticide is a new tool for the control of mite populations in turf. Using a mite growth regulator, Finesse® does not kill adult mites, but sterilises adult females, prevents egg hatch, and kills larvae and nymphs as they moult, controlling the mite population before it has a chance to establish. This makes it ideal for use in preventing the establishment of a damaging mite population. When it comes to controlling mites, you need to go in first with a bit of Finesse®!

Spring application (Nov) - Terry Hills Country Club

Key benefits of using Finesse®

- Prevents build up of damaging mite populations with early season application
- Unique insecticide group (10B) making it idea for rotation in programs to manage resistance.
- Potential for reduced overall program costs by reducing adulticide applications
- Translaminar movement to ensure distribution to mite feeding sites
- Soft on beneficials

Application tips

- Apply when the mite population is still developing and predominantly juvenile (careful monitoring required)
- If significant adult population is in place and adulticide application should be applied first

Finesse® at a glance

Use	For control of mites in turf
Active Ingredient	Etoxazole
Mode of Action	Group 10B insecticide
Formulation	Suspension concentrate
Pack Size	500 ml
Rate	200 ml/ha (2 ml/100 m ²)
Application timing	Spring (early mite season)
